

Monitoring Utilization Metrics

Objective

Monitor warehouse activity, storage consumption, and query performance.

A. Warehouse Utilization

Steps

1. Navigate to **Warehouses**.
2. Select **TEST_WAREHOUSE**.
3. Open **Details**.

Metrics Reviewed

Query Load

- Displays the number of active concurrent queries.

Queued Queries

- Indicates whether workloads exceed warehouse capacity.

Analysis

- High query load may require warehouse scaling.
- Frequent queued queries suggest insufficient compute resources.

Details		
Type	Status	Running
Standard	Suspended	0 queries
Queued	Size	Max Clusters
0 queries	X-Small	1
Min Clusters	Scaling Policy	Auto Suspend
1	STANDARD	5 minutes (300 seconds)
Auto Resume	Resumed On	Query Acceleration
Enabled	37 minutes ago	Enabled
Scale Factor	Resource Constraint	
2	STANDARD_GEN_2	

B. Storage Usage Monitoring

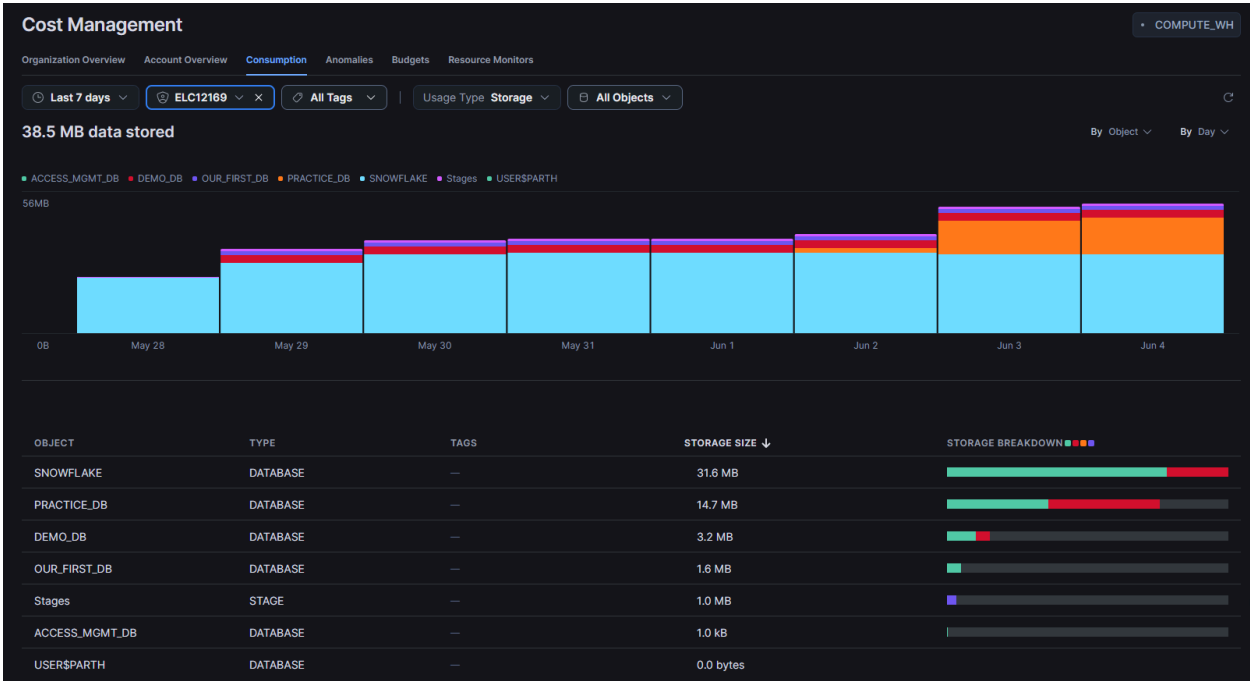

Steps

- 1. Navigate to the **Account** section.
- 2. Open **Storage**.

Metrics Reviewed

- Total Storage Used
- Database-wise Storage Consumption
- Historical Storage Trends

Analysis

C. Query Execution Metrics

Steps

- 1. Open the **History** tab.
- 2. Select a query execution record.

Metrics Reviewed

Query Duration

Total execution time of the query.

Bytes Scanned

Amount of data scanned during execution.

Compilation Time

Time required for query optimization and compilation.

Analysis

These metrics assist in identifying:

- Slow-running queries
 - Inefficient scans
 - Optimization opportunities
-
